Date of Submission: _____

1. Objectives and project overview

The assignment builds an information and registration page for SEU Tech Event 2026 using HTML. The page presents the event introduction, activities, participation steps, schedule, registration fields and contact information.

Objectives

- Use semantic elements to organise a complete webpage.
- Create navigation links, ordered and unordered lists, a nested list and a schedule table.
- Embed an image with alternative text and provide external and email links.
- Build a labelled registration form using appropriate input types and native validation.

Tools and source files

HTML5 and Google Chrome. Node.js and Playwright were used to capture actual browser output and verify the report evidence.

Check / concept	Observation
index.html	Complete event page and registration form.
style.css	Referenced by index.html but absent from the current folder. The page uses the default browser appearance.
images/event picture.jpg	Local event photograph.

Scope

The report describes the supplied Lab 1 implementation. The form has no backend handler, database or JavaScript storage. Its required fields and email format are checked by the browser.

2. Implementation and key concepts

Check / concept	Observation
Semantic structure	header identifies the event, nav holds section links, main contains the page content, and footer provides contact details.
Lists	Unordered lists present goals; nested lists group sessions and competitions; an ordered list explains participation steps.
Table	thead and tbody separate headings from four schedule entries. Each row includes date, time, activity and venue.
Form controls	Text, email and date fields collect details. Radio buttons share a participation name so only one option can be selected. Checkboxes allow multiple interests.
Accessibility	Labels reference input IDs; the image has alt text; headings organise sections.

Representative source code

```
<nav>
  <a href="#home">Home</a> |
  <a href="#about">About Event</a> |
  <a href="#schedule">Schedule</a> |
  <a href="#registration">Registration</a> |
  <a href="#contact">Contact</a>
</nav>

<label for="email">Email Address:</label>
<input type="email" id="email" name="email"
  placeholder="Enter your email" required>
```

The excerpt retains the actual element names and attributes while condensing source whitespace. Fragment links navigate within the same document. The email type and required attribute supply native browser validation.

3. Browser output — event information

SEU Tech Event 2026

Information and Registration Page

Welcome to SEU Tech Event 2026

Welcome to the **SEU Tech Event 2026**, a technology-focused event organized for students who are interested in modern technology, programming, artificial intelligence, networking, and innovation.

The event will provide students with an opportunity to learn new skills, meet technology enthusiasts, participate in competitions, and share innovative ideas with other students.

Figure 1. Actual Lab 1 page in Chrome at a 1000×900 viewport. The browser applies its default HTML styling.

4. Browser output — schedule and form

Event Schedule

The following table shows the main activities planned for the SEU Tech Event 2026.

Date	Time	Activity	Venue
10 October 2026	10:00 AM	Opening Ceremony	SEU Auditorium
10 October 2026	11:00 AM	Web Development Workshop	Computer Lab
11 October 2026	10:30 AM	Programming Contest	Computer Lab
11 October 2026	2:00 PM	AI and Cyber Security Seminar	SEU Auditorium

Figure 2. Four event activities organised in a schedule table.

Event Registration

Interested students can register by completing the form below. Please provide correct information so that the organizers can contact you regarding the event.

Full Name:

Student ID:

Email Address:

Preferred Date:

 

Preferred Participation Type:

- ☒ Participant
☐ Volunteer
☐ Visitor

Areas of Interest:

- ☐ Programming
☐ Artificial Intelligence
☒ Web Development

Figure 3. Completed form used for validation checks. student@example.com is test data; the form was not submitted.

5. Verification, limitations and conclusion

- PASS: Event image loads, all five navigation anchors have targets, form labels match inputs, and the schedule has four activity rows.
- PASS: Empty required fields fail browser validation; a completed form with a valid-format sample email passes.
- PASS: The email input rejects an invalid email format. No server submission was attempted.
- OBSERVED: At 390px viewport width, the fixed-width event image causes horizontal overflow.

Result

The supplied HTML successfully renders the event content, lists, schedule and form. Native browser validation detects missing required values and an invalid email format.

Limitations and possible improvements

The 700-pixel image is not responsive in this HTML-only version. A later CSS stage can apply max-width: 100% and height: auto. Grouping related radio buttons and checkboxes with fieldset and legend would improve form semantics. A backend or storage feature is needed to retain registrations.

Conclusion

This implementation demonstrates how HTML describes both page structure and user input. Styling and interactive behaviour can be added in later stages without replacing the underlying event content.
